Journal-neutral draft for Composable Assurance for Sovereign Digital Currency

6 August 2026

Editor-in-Chief
[TARGET JOURNAL]
[PUBLISHER]

Dear Editor-in-Chief,

Please consider our Original Research Article, **Composable Assurance for Sovereign Digital Currency: Privacy, financial integrity, adaptive policy and national-scale qualification across independent sovereign ledgers**, for publication in [TARGET JOURNAL].

The manuscript addresses a central obstacle in CBDC research: individual mechanisms for monetary issuance, privacy, financial integrity, cross-border settlement, economic safeguards and operational resilience have been studied separately, but a national system must compose them without allowing one objective to invalidate another.

Principal contributions

1. A sovereign-boundary architecture and evidence-bound payment-versus-payment protocol that keeps each currency on its domestic ledger and uses explicit PREPARE and terminal COMMIT-or-ABORT certificates.
2. A privacy methodology combining learned metadata-linkage attacks with a separately scoped, person-level differential-privacy service for registered public statistics.
3. Leakage-controlled AML/CFT experiments, calibrated sanctions policy frontiers with prevalence-adjusted workload, and a prospective effectiveness protocol that distinguishes prediction from FATF outcomes.
4. A partially identified and adaptively governed economic-policy framework, plus a four-stage national qualification programme that can falsify unsafe scale claims rather than extrapolate from local microbenchmarks.

The article reports formal-model, synthetic-benchmark, laboratory-prototype and queueing-digital-twin evidence. It does not claim national deployment, certified cryptography, operational AML effectiveness or a universal CBDC holding limit. This explicit evidence boundary is central to the paper's scientific contribution.

The manuscript is original, is not under consideration elsewhere, and has not been published in substantially the same form. The accompanying package contains a blinded manuscript, title page, figures, supplementary information, declarations, code and data artifact, an immutable Git bundle and internal verification material. Funding, competing interests, data availability, code availability and ethics statements are supplied separately.

The manuscript should be relevant to readers working in payment systems, digital money, privacy engineering, financial integrity, monetary economics, distributed systems and operational resilience. Suggested reviewers are provided separately and must be screened by the editorial office for independence.

Sincerely,

Md Zubaer Mahmood Zubraj
