

Reproducibility Artifact README

Version 7.0.0 | immutable commit 6fc7fa1ce098873b81fdb9dedb4e097c72727b93

Evidence boundary

The package reports formal-model, synthetic-benchmark, laboratory-prototype and queueing-digital-twin evidence. It does not claim a national CBDC deployment, production-certified cryptography, operational FATF effectiveness or a universal monetary-policy limit.

Contents

Scripts reproduce protocol, privacy, differential-privacy, AML/CFT, sanctions, economic-policy and national-qualification experiments. Results are machine readable; figures are regenerated from scripts; verification files check key claims and checksums; an immutable Git bundle records the source state.

Reproduction

```
python -m venv .venv
source .venv/bin/activate
pip install -r requirements.txt
./RUN_ALL.sh
./VERIFY.sh
```

Artifact identity

Version 7.0.0
Commit 6fc7fa1ce098873b81fdb9dedb4e097c72727b93
Code licence Apache-2.0
Public URL and DOI: to be assigned before submission.

External gates

National deployment claims require physical multi-region execution, certified HSMS, realistic PIP workloads, independent security and legal audits, governed real-data privacy/AML studies, live multilingual sanctions adjudication, jurisdiction-specific economic estimation and controlled pilots.
