

Originality and Similarity Preflight

Internal report - not a certified external plagiarism check | 6 August 2026

Scope of this report

This is an internal originality preflight, not an iThenticate, Crossref Similarity Check or Turnitin certificate. No proprietary publication or thesis similarity database was available.

Checks performed

- Exact scan for legacy project terminology and author-identifying text in the blinded file.
- Internal duplicate-paragraph and repeated-sentence scan.
- Citation-number coverage check against the reference list.
- Confirmation that the manuscript labels external ideas and institutional projects through citations.
- Metadata scrub of the blinded manuscript.

Result

No legacy Smart Taka, ERC-20, ERC-621 or ReasonedTransfer terminology was detected in the latest manuscript. No duplicate full paragraphs were detected. All numbered references are cited at least once in the body according to the automated audit. These checks do not exclude paraphrase similarity with external literature.

Required external action

Run the final manuscript through the target publisher's accepted similarity service immediately before submission. Review every high-similarity segment manually, retain correctly quoted or standard methodological language where justified, and revise unattributed overlap. Do not use a numeric similarity threshold as a substitute for editorial judgment.
